

Brussels Region monitors traffic in real time 24/7 with ViaPro

CONTEXT

The Brussels region includes 19 municipalities and 1.3M inhabitants. The Brussels Mobility Center monitors traffic 24/7, including 26 tunnels and more than 500 intersections, thanks to 600 cameras, detection loops and a traffic light management center. Other sources of information must also be combined, as well as infrastructure information, in order to be able to react efficiently and accurately.

SOLUTION

The Brussels Mobility Center uses the ViaPro solution to monitor incidents in real time from more than 10 different, collaborative and official sources. ViaPro is displayed on the screens of the Traffic Control Center and presents in a synthetic way all disruptions analyzed, filtered and merged in real time by the NextAlert artificial intelligence engine.
