

How Département du Loiret streamlines emergency management and increases reactivity with ViaPro

CONTEXT

Loiret has a population of nearly 700,000 inhabitants, with many rivers, industrial and power plants, along with explosives and fuel depots.

Risks of various types (industrial, environmental, terrorists, ...) are managed in cooperation with national and local authorities. Depending on the event, road managers are in charge of blocking roads according to risk scenarios and quickly inform professionals and road users.

Information is difficult to share due to the different information systems used by each of the authorities in charge.

SOLUTION

ViaPro is used in three ways:

- by **road workers** to enter in real time blocked roads on the field, through their smartphone or tablet. Information is automatically sent to connected and public apps, including Waze ;
- by **crisis managers**, to share real time information on their computer or in the crisis room ;
- by **rescue services**, to know what are the blocked roads and calculate relevant journeys for trucks through the app.

BENEFITS

of road information covered

of information sent to professionals and drivers

to enter or modify an event

“ViaPro is useful to indicate users and professionals the roads blocked during a crisis”

Didier R., Deputy Director of Risk Management - Crisis Management
